

Off to College—Student’s Medical Tool Kit (2023)

Anjini Virmani, MD

College Health Physician & Educator

Getting organized for college is complicated. Dorm room supplies, checklists, orientations can take much of your time. The last thing on your mind is getting sick, after all, you’re healthy.

But taking time to pack some medical supplies can save you a headache (literally) and some money later. It is likely someone—you, a roommate or friend will have a cold or flu during the upcoming months. It will be great to be prepared.

At your pre-college physical examination (checkup), discuss medications with your regular doctor. If you take any medication regularly, make sure there are no interactions with common drugstore medications. For example, ADD medications should not be taken with other stimulating medications like some cold medications. If you are an athlete, follow your coach’s guidelines on allowed medications. Your phone will be valuable to store information so make sure it is password protected. Look at this checklist with your family and stock up before you start school. Keep your supplies in a clean container or disposable plastic bags and check expiration dates every few months. Buy your own supplies rather than a prepared first aid kit. Check with your doctor or pharmacist on how to take these medications or call your college health clinic with questions. You should call yourself, not your parents, as you will be taking care of yourself once you get to college.

If you get sick at college and start an over-the-counter medication, consider seeing the college health clinic or calling your doctor for advice to make sure you are using them correctly. Any serious symptoms such as fevers or unusual rashes need to be seen right away.

If you have an ongoing medical condition, even a minor one, plan your care ahead of time with your current doctor and the college health clinic. It’s hard to make arrangements during the hectic move in time or worse, in the middle of midterms.

- Medical Contact list—doctors, therapists, dentists, and specialty doctors that you see with their names, hospital locations and phone numbers. Put this into your phone contact list to access quickly. Add your preferred pharmacy information.
- Medical Communication Permissions—find out how to give your college health clinic permission to talk to your family (if you want this for certain problems and maybe not others). Discuss your medical privacy preferences with your family. Students over the age of 18 are adults and the college clinic will require your permission to speak to your parents about health care.
- **Health Insurance card**—keep in your wallet and leave a copy with your family.
- **List of medications, medication allergies and vaccinations** —on your phone or on a secure site
- College Health Clinic information—location, hours & phone number—in your phone
- College Emergency contact information—verify the college’s Public Safety contact information—in your phone.
- Local Health resources: Local pharmacies and Urgent care centers for after-hours care.
- Your prescription medication—if you take medication—ideally a 90-day supply —and a plan for getting refills from home or college health doctor

- If needed: Both a pair of eyeglasses and extra contact lenses. Glasses will be a backup for contact lenses wearers during late nights or illnesses. Get your prescription updated with your eye doctor before college.
- If needed: A plan to obtain special medications or treatments ahead of time. Arrange with your doctor and the college health doctor: ADD medication refills or allergy shots
- If needed: Arrange follow up doctor, dental or surgery appointments during college breaks
- A digital thermometer—very important!
- Bandages, assorted sizes
- Antibiotic ointment and alcohol wipes
- Disposable gloves, scissors, and tweezers
- Acetaminophen for fevers, headaches
- Ibuprofen for muscle aches, fevers, headaches
- Cough medication: Dextromethorphan (cough suppressant) or Guaifenesin (expectorant—thins mucus to cough out better) and cough drops
- Decongestant (Runny or congested nose or sinuses) --Pseudoephedrine or Phenylephrine—avoid if taking ADD medications.
- Cream for rashes or insect bites—hydrocortisone 1%
- Allergy medication—diphenhydramine (Benadryl) for allergic reaction
- Loratadine or Fexofenadine for seasonal or pollen allergies
- Ice Packs—reusable
- Stomach medications—Maalox or Tums for indigestion, Imodium for diarrhea
- Condoms, and if female, consider Birth control pills, Monistat and Plan B
- Hand sanitizer, mini for backpack and large pump for dorm

COVID-19: The Health emergency is officially ending as of May 11, 2023. The COVID-19 vaccine may no longer be required, but will likely be recommended, to be on campus. However, COVID-19 may still be an issue when you start college this fall. Be sure to discuss COVID-19 treatment options, if needed, with your doctor if you have any ongoing medical illnesses that could worsen a COVID infection such as asthma. Some colleges will continue to offer testing to students for COVID-19. Please attend your college health and housing orientation webinars this summer to find out the most up to date plans at your college. Health is a major concern when you live in close quarters in a college environment. Hopefully much of this health issue is improving, and you will be off to a fun college experience!
